

Application of Information & Communication Technologies

Lecture-6

Recap of Lecture 5

- ◆ Inside System Unit
 - Ports & Cables
 - Expansion Cards and Slots

Overview of Lecture 6

- ◆ Buses
- ◆ Memory
- ◆ ROM
- ◆ RAM
- ◆ Flash

What is a Bus?

- ◆ **Bus = electronic pathway inside computer.**
- ◆ **Used to transfer data, addresses, control signals.**

What is a Bus?

FIGURE 2-16
Buses and expansion slots. Buses transport bits and bytes from one component to another, including the CPU, cache, RAM, and peripheral devices.

Type of Buses

- ◆ **Data Bus** → moves actual data
- ◆ **Address Bus** → tells where data goes
- ◆ **Control Bus** → manages signals

Buses Width

- ◆ **Width** = number of wires/lines.
- ◆ **Wider bus** → more data per cycle
 - (E.g., 8-bit, 16-bit, 32-bit, 64-bit)

Buses speed

- ◆ **Speed** = how fast data travels.
- ◆ Measured in MHz or GHz.

Bandwidth

- ◆ **Bandwidth** = Bus Width × Bus Speed.
- ◆ Bus width and speed determine the throughput
- ◆ Example:
 - 32-bit bus × 100 MHz = 400 MB/s.

System vs Expansion Bus

- ◆ **System Bus → between CPU & Memory.**
- ◆ **Expansion Bus → connects to peripherals (USB, PCI, etc.).**

Memory and Registers

- ◆ **Stores data and instructions.**
 - **Types: ROM, RAM, Cache, Flash.**
- ◆ **Registers: Very small and high speed memory inside CPU.**
 - **Stores data being used right now.**

ROM

- ◆ **Read Only Memory.**
- ◆ **Permanent → cannot be changed easily.**
- ◆ **Used to store startup instructions.**
- ◆ **Retrieved by the computer when needed**
- ◆ **BIOS stored in ROM**
- ◆ **Types of ROM:**
 - **PROM → Programmable ROM**
 - **EPROM → Erasable ROM**
 - **EEPROM → Electrically Erasable ROM**

RAM

- ◆ **Random Access Memory.**
- ◆ **Temporary storage for active programs.**
- ◆ **Volatile → erased when power off.**
- ◆ **Why RAM is Important?**
 - **More RAM = faster performance.**
 - **Needed to run modern apps.**

Types of RAM

- ◆ DRAM (Dynamic RAM)
- ◆ SRAM (Static RAM, faster)
- ◆ SDRAM, DDR, DDR2, DDR3, DDR4
- ◆ RAM Modules
- ◆ DIMM, SIMM, RIMM (physical sticks).

FIGURE 2-12
MRAM is a type of nonvolatile RAM.

The memory module contains memory chips.

This part of the memory module is plugged into a memory slot on the motherboard.

FIGURE 2-11
A DIMM RAM memory module.

Flash Memory

- ◆ **Non-volatile**
- ◆ **can be erased and reprogrammed or rewritable**
- ◆ **Used in USB drives, SSDs, memory cards.**

What is Cache Memory?

- ◆ **Small, very fast memory close to CPU.**
- ◆ **Stores frequently used instructions/data.**
- ◆ **Levels of Cache**
 - **L1 Cache → inside CPU (fastest, smallest).**
 - **L2 Cache → near CPU (bigger, slower than L1).**
 - **L3 Cache → shared by cores.**

RAM vs ROM vs Cache

Feature	RAM	ROM	Cache
Volatility	Temporary	Permanent	Temporary (like RAM)
Speed	Fast	Slower	Very Fast (closer to CPU)
Location	On motherboard	On motherboard (chip)	Inside/near CPU
Function	Run programs	Store startup code	Stores frequently used instructions/data

Summary

- ◆ Buses
- ◆ Memory
- ◆ ROM
- ◆ RAM
- ◆ Flash
